This is a Next.js project bootstrapped with `create-next-app`.

Getting Started

Environment variables

The contact form sends emails through Resend. Copy the
example environment file and fill in your credentials before running the app:

```
cp .env.local.example .env.local
```

- `RESEND_API_KEY` — API key from your Resend dashboard.
- `RESEND_FROM_EMAIL` — verified email address that Resend can send from.
- `CONTACT_TO_EMAIL` — destination inbox for inbound contact requests.

First, run the development server:

```
npm run dev
# or
yarn dev
# or
pnpm dev
# or
bun dev
```

Open http://localhost:3000 with your browser to see the result.

Can start editing the page by modifying `app/page.tsx`. The page auto-updates as you edit the file.

This project uses `next/font` to automatically optimize and load Geist, a new font family for Vercel.

Deploy on Vercel

The easiest way to deploy this Next.js app is to use the Vercel Platform from the creators of Next.js.
